

EPRT Therapy

Stress on the body results in the formation of toxins called free radicals. These free radicals have the ability to scavenge electrons from biological molecules. The EPRT devices produces a steady stream of electrons at a relatively low, but constant, concentration and have the ability to donate electrons to neutralize free radicals protecting the body from the harm of stress. The 3D animation will visually guide you through how the EPRT process works (described as "ElectroRegenesiis" in the video).
